

**Not on
Midterm 1**

61A Lecture 10

Monday, September 17

Sequence Iteration

```
def count(s, value):  
    total = 0  
    for elem in s:
```

Name bound in the first frame
of the current environment

```
        if elem == value:  
            total = total + 1  
    return total
```

For Statement Execution Procedure

```
for <name> in <expression>:  
    <suite>
```

1. Evaluate the header <expression>, which must yield an iterable value.
2. For each element in that sequence, in order:
 - A. Bind <name> to that element in the first frame of the current environment.
 - B. Execute the <suite>.

Sequence Unpacking in For Statements

A sequence of
fixed-length sequences

```
>>> pairs = ((1, 2), (2, 2), (2, 3), (4, 4))
```

```
>>> same_count = 0
```

A name for each element in
a fixed-length sequence

Each name is bound to a value,
as in multiple assignment

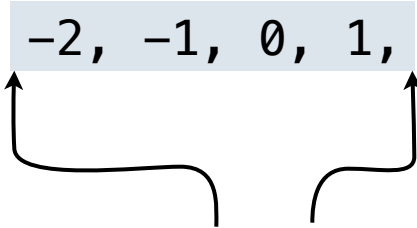

```
>>> for x, y in pairs:
    if x == y:
        same_count = same_count + 1
```

```
>>> same_count
2
```

The Range Type

A range is a sequence of consecutive integers.*

..., -5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, ...

range(-2, 2)

Length: ending value - starting value

(Demo)

Element selection: starting value + index

```
>>> tuple(range(-2, 2))  
(-2, -1, 0, 1)
```

Tuple constructor

```
>>> tuple(range(4))  
(0, 1, 2, 3)
```

With a 0 starting value

* Ranges can actually represent more general integer sequences.

Membership & Slicing

The Python sequence abstraction has two more behaviors!

Membership.

```
>>> digits = (1, 8, 2, 8)
>>> 2 in digits
True
>>> 1828 not in digits
True
```

Slicing.

```
>>> digits[0:2]
(1, 8)
>>> digits[1:]
(8, 2, 8)
```

Strings are an Abstraction

Representing data:

`'200'` `'1.2e-5'` `'False'` `'(1, 2)'`

Representing language:

```
"""And, as imagination bodies forth  
The forms of things to unknown, and the poet's pen  
Turns them to shapes, and gives to airy nothing  
A local habitation and a name.  
"""
```

Representing programs:

```
'curry = lambda f: lambda x: lambda y: f(x, y)'
```

Demo

String Literals Have Three Forms

```
>>> 'I am string!'
'I am string!'
```

```
>>> "I've got an apostrophe"
"I've got an apostrophe"
```

Single- and double-quoted strings are equivalent

```
>>> '您好'
'您好'
```

```
>>> """The Zen of Python
claims, Readability counts.
Read more: import this."""
'The Zen of Python\nclaims, Readability counts.\nRead more:
import this.'
```

A backslash "escapes" the following character

"Line feed" character represents a new line

Strings are Sequences

```
>>> city = 'Berkeley'
```

```
>>> len(city)
```

```
8
```

```
>>> city[3]  
'k'
```

An element of a string
is itself a string!

Length. A sequence has a finite length.

Element selection. A sequence has an element corresponding to any non-negative integer index less than its length, starting at 0 for the first element.

```
>>> 'Berkeley' + ', CA'
```

```
'Berkeley, CA'
```

```
>>> 'Shabu ' * 2
```

```
'Shabu Shabu '
```

String arithmetic is similar
to tuple arithmetic

String Membership Differs from Other Sequence Types

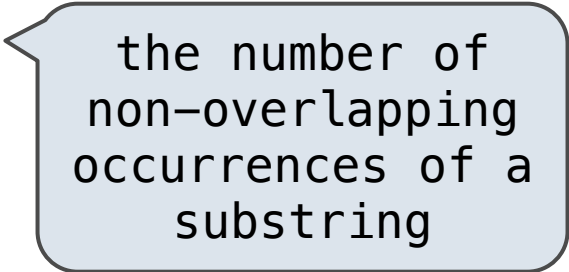

The "in" and "not in" operators match substrings

```
>>> 'here' in "Where's Waldo?"  
True
```

Why? Working with strings, we care about words, not characters

The count method also matches substrings

```
>>> 'Mississippi'.count('i')  
4  
>>> 'Mississippi'.count('issi')  
1
```

the number of
non-overlapping
occurrences of a
substring

Representing Strings: the ASCII Standard

American Standard Code for Information Interchange

ASCII Code Chart

"Bell"
"Line feed"

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	NUL	SOH	STX	ETX	EOT	ENQ	ACK	BEL	BS	HT	LF	VT	FF	CR	SO	SI

7	p	q	r	s	t	u	v	w	x	y	z	{		}	~	DEL

16 columns: 4 bits

- Layout was chosen to support sorting by character code
- Rows indexed 2–5 are a useful 6-bit (64 element) subset
- Control characters were designed for transmission

Demo

Representing Strings: the Unicode Standard

- 109,000 characters
- 93 scripts (organized)
- Enumeration of character properties, such as case
- Supports bidirectional display order
- A canonical name for every character

聾	聾	聾	聽	聵	聵	職	瞻
8071	8072	8073	8074	8075	8076	8077	8078
健	腭	腳	腴	暇	暇	膈	腸
8171	8172	8173	8174	8175	8176	8177	8178
艱	色	艷	艷	艷	艷	艷	艸
8271	8272	8273	8274	8275	8276	8277	8278
菟	菟	荳	扶	葱	吟	荷	葶
8371	8372	8373	8374	8375	8376	8377	8378
葱	菖	葳	葳	葵	葶	葶	蔥

http://ian-albert.com/unicode_chart/unichart-chinese.jpg

U+0058 LATIN CAPITAL LETTER X

U+263a WHITE SMILING FACE

U+2639 WHITE FROWNING FACE

Demo

Representing Strings: UTF-8 Encoding

UTF (UCS (Universal Character Set) Transformation Format)

Unicode: Correspondence between characters and integers

UTF-8: Correspondence between numbers and bytes

A byte is 8 bits and can encode any integer 0–255

	00000000	0	
bytes	00000001	1	integers
	00000010	2	
	00000011	3	

Variable-length encoding: integers vary in the number of bytes required to encode them!

In Python: `string` length in characters, `bytes` length in bytes

Demo

Sequences as Conventional Interfaces

Consider two problems:

- ▶ Sum the even members of the first n Fibonacci numbers.
- List the letters in the acronym for a name, which includes the first letter of each capitalized word.

enumerate naturals: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11.

map fib: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55.

▲ ▲ ▲ ▲

filter iseven: 0, 2, 8, 34, .

accumulate sum: ., ., ., ., 44.

Sequences as Conventional Interfaces

Consider two problems:

- Sum the even members of the first n Fibonacci numbers.
- ▶ ▪ List the letters in the acronym for a name, which includes the first letter of each capitalized word.

enumerate words: 'University', 'of', 'California', 'Berkeley'

filter iscap: 'University', 'California', 'Berkeley'

map first: 'U', 'C', 'B'

accumulate tuple: ('U', 'C', 'B')

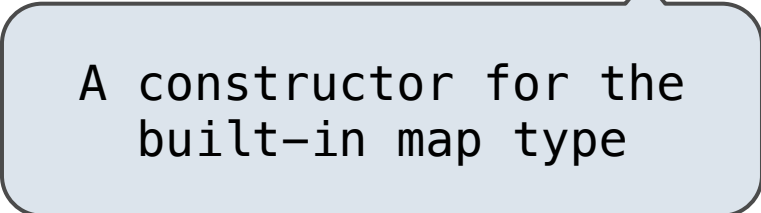

Mapping a Function over a Sequence

Apply a function to each element of the sequence

```
>>> alternates = (-1, 2, -3, 4, -5)
```

```
>>> tuple(map(abs, alternates))  
(1, 2, 3, 4, 5)
```

The returned value of **map** is an iterable map object

A constructor for the
built-in map type

The returned value of **filter** is an iterable filter object

Demo

Accumulation and Iterable Values

Iterable objects give access to some elements in order.

Python-specific construct; less specific than a sequence

Many built-in functions take iterable objects as argument.

<code>tuple</code>	Return a tuple containing the elements
<code>sum</code>	Return the sum of the elements
<code>min</code>	Return the minimum of the elements
<code>max</code>	Return the maximum of the elements

For statements also operate on iterable values.

Demo

Generator Expressions

One large expression that evaluates to an iterable object

```
(<map exp> for <name> in <iter exp> if <filter exp>)
```

- Evaluates to an iterable object.
- `<iter exp>` is evaluated when the generator expression is evaluated.
- Remaining expressions are evaluated when elements are accessed.

Short version: `(<map exp> for <name> in <iter exp>)`

Precise evaluation rule introduced in Chapter 4.

Demo

Reducing a Sequence

Reduce is a higher-order generalization of max, min, & sum.

```
>>> from operator import mul  
  
>>> from functools import reduce  
  
>>> reduce(mul, (1, 2, 3, 4, 5))  
120
```

First argument:
A two-argument
function

Second argument:
an iterable object

Like accumulate from Homework 2, but with iterable objects
