

## What Are Programs?

Once upon a time, people wrote programs on blackboards

Every once in a while, they would "punch in" a program

Now, we type programs as text files using editors like Emacs

Programs are just text (or cards) until we interpret them

## How Are Evaluation Procedures Applied?

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The most fundamental idea in computer science:

An *interpreter*, which determines the meaning of expressions in a programming language, is just another program.

3

## Recursive Functions

**Definition:** A function is called *recursive* if the body of that function calls itself, either directly or indirectly.

**Implication:** Executing the body of a recursive function may require applying that function again.

Drawing Hands, by M. C. Escher (lithograph, 1948)

4

## Example: Pig Latin

Yes, you're in college, learning Pig Latin.

```
def pig_latin(w):  
    """Return the Pig Latin equivalent of English word w."""  
    if starts_with_a_vowel(w):  
        return w + 'ay'  
    return pig_latin(w[1:] + w[0])  
  
def starts_with_a_vowel(w):  
    """Return whether w begins with a vowel."""  
    return w[0].lower() in 'aeiou'
```

Demo

5

## The Anatomy of a Recursive Function

- The **def statement header** is similar to other functions
- Conditional statements check for **base cases**
- Base cases are evaluated **without recursive calls**
- Typically, all other cases are evaluated **with recursive calls**

Recursive functions are like ants (more or less)

```
def pig_latin(w):  
    if starts_with_a_vowel(w):  
        return w + 'ay'  
    return pig_latin(w[1:] + w[0])
```

6

## Iteration vs Recursion

Iteration is a special case of recursion

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Using iterative control:

```
def fact_iter(n):
    total, k = 1, 1
    while k <= n:
        total, k = total*k, k+1
    return total
```

Using recursion:

```
def fact(n):
    if n == 1:
        return 1
    return n * fact(n-1)
```

**Math:**  $n! = \prod_{k=1}^n k$

$$n! = \begin{cases} 1 & \text{if } n = 1 \\ n \cdot (n-1)! & \text{otherwise} \end{cases}$$

**Names:** n, total, k, fact\_iter

n, fact

Demo

## The Recursive Leap of Faith

```
def fact(n):
    if n == 1:
        return 1
    return n * fact(n-1)
```

Is fact implemented correctly?

1. Verify the base case.
2. Treat fact(n-1) as a functional abstraction!
3. Assume that fact(n-1) is correct.
4. Verify that fact(n) is correct, assuming that fact(n-1) correct.

Photo by Kevin Lee, Preikestolen, Norway

## Example: Reverse a String

```
def reverse(s):
    """Return the reverse of a string s."""
```

**Recursive idea:** The reverse of a string is the reverse of the rest of the string, followed by the first letter.

```
antidisestablishmentarianism
a ntidisestablishmentarianism
    ↓
msinairatnemhsilbatsesiditn a
reverse(s[1:]) + s[0]
```

**Base Case:** The reverse of an empty string is itself.

## Converting Recursion to Iteration

**Can be tricky!** Iteration is a special case of recursion

**Idea:** Figure out what state must be maintained by the function

```
def reverse(s):
    if s == '':
        return s
    return reverse(s[1:]) + s[0]
```

What's reversed so far?

How to get each incremental piece

```
def reverse_iter(s):
    r, i = '', 0
    while i < len(s):
        r, i = s[i] + r, i + 1
    return r
```

## Converting Iteration to Recursion

**More formulaic:** Iteration is a special case of recursion

**Idea:** The state of an iteration can be passed as parameters

```
def reverse_iter(s):
    r, i = '', 0
    while i < len(s):
        r, i = s[i] + r, i + 1
    return r
```

Assignment becomes...

```
def reverse2(s):
    def reverse_s(r, i):
        if not i < len(s):
            return r
        return reverse_s(s[i] + r, i + 1)
    return reverse_s('', 0)
```

Arguments to a recursive call
