

Lecture #40: Course Summary

- Autograder will start running this weekend.
- Please use git-bug for problems with submission, your code, the skeleton, or any of our software.
- **Readers and lab assistants needed.** Consider volunteering to be a reader or lab assistant for CS 10, self-paced courses, CS 61A, or CS 61B next semester.
- **Programming Contest:** Visit my web page for information about the annual programming contest, which we hold each fall. There are large collections of programming problems you can try your hand on.

Course Topic Summary

- Programming language: Java
- Program Analysis
- Categories of data structure: Java library structure
- Sequences
- Trees
- Searching
- Sorting
- Pseudo-random numbers
- Graphs
- Pragmatic implementation topics

Programming-Language Topics

- Object-based programming: organizing around data types
- Object-oriented programming:
 - Dynamic vs. static type
 - Inheritance
 - Idea of interface vs. implementation
- Generic programming (the `<...>` stuff).
- Memory model: containers, pointers, arrays
- Numeric types
- Java syntax and semantics
- Scope and extent
- Standard idioms, patterns:
 - Objects used as functions (e.g., Comparator)
 - Partial implementations (e.g., AbstractList)
 - Iterators
 - Views (e.g., sublists)

Analysis

- Asymptotic analysis
- $O(\cdot)$, $o(\cdot)$, $\Omega(\cdot)$, $\Theta(\cdot)$ notations
- Worst case, average case.
- Amortized time

Major Categories of Data Structure

- Collection interface and its subtypes
- Map interface and its subtypes
- Generic skeleton implementations of collections, lists, maps (AbstractList, etc.)
- Complete concrete collection and map classes in Java library

Sequences

- Linking:
 - Single and double link manipulations
 - Sentinels
- Linking vs. arrays
- Stacks, queues, dequeues
- Circular buffering
- Trade-offs: costs of basic operations

Trees

- Uses of trees: search, representing hierarchical structures
- Basic operations: insertion, deletion
- Tree traversals
- Representing trees
- Game trees

Searching

- Search trees, range searching
- Multidimensional searches: quad trees.
- Hashing
- Priority queues and heaps
- Balanced trees
 - Rebalancing by rotation (red-black trees)
 - Balance by construction (B-trees)
 - Probabilistic balance (skip lists)
 - Tries
- Search times, trade-offs

Sorting

- Uses of sorting
- Insertion sort
- Selection sorting
- Merge sort
- Heap sort
- Quicksort and selection
- Distribution sort
- Radix sort
- Complexity of various algorithms, when to use them?

Random numbers

- Possible uses
- Idea of a pseudo-random sequence
- Linear congruential and additive generators
- Changing distributions:
 - Changing the range
 - Non-uniform distributions
- Shuffling, random selection

Graph structures

- Definition
- Uses: things represented by graphs
- Graph traversal: the generic traversal template
- Depth-first traversal, breadth-first traversal
- Topological sort
- Shortest paths
- Minimal spanning trees, union-find structures
- Memory management as a graph problem.

Debugging

- What debuggers can do
- How to use to pin down bugs
- Details of some debugger (Eclipse, gjdb, various Windows/Sun products).
- Unit testing: what it means, how to use it.
- JUnit mechanics.

Version Control

- What's it for?
- Basic concepts behind our particular system:
 - Working copy vs. repository copy
 - Committing changes
 - Updating and merging changes.
 - Tagging

A Case Study

- Presented Git version-control system as an example of a design using several ideas from this course.
- **Graph (DAG)** and **tree** structures represented with files as vertices and strings (file names), rather than machine addresses, as pointers.
- Use of hashing to create unique (or very, very likely to be unique) names: *probabilistic data structure*.
- Compression uses various kinds of **map** to facilitate conversion to and from compressed form, including **arrays**, **tries**, and **hash tables**
- **Priority queue** in Huffman coding.
