1 Basic Algorithmic Analysis

For each of the following function pairs $f$ and $g$, list out the $\Theta$, $\Omega$, $O$ relationships between $f$ and $g$, if any such relationship exists. For example, $f(x) \in O(g(x))$.

1. $f(x) = x^2$, $g(x) = x^2 + x$
2. $f(x) = 500000x^3$, $g(x) = x^5$
3. $f(x) = \log(x)$, $g(x) = 5x$
4. $f(x) = e^x$, $g(x) = x^5$
5. $f(x) = \log(5^x)$, $g(x) = x$

2 Practice with Runtime

For each of the following functions, find the Big-Theta expression for the runtime of the function in terms of the input variable $n$.

You may find the following relations helpful:

\[ 1 + 2 + 3 + 4 + \cdots + N = \Theta(N^2) \]
\[ 1 + 2 + 4 + \cdots + N = \Theta(N) \]

1. For this problem, assume that the static method $\text{constant}$ runs in $\Theta(1)$ time.

```java
public static void bars(int n) {
    for (int i = 0; i < n; i += 1) {
        for (int j = 0; j < i; j += 1) {
            System.out.println(i + j);
        }
    }
    for (int k = 0; k < n; k += 1) {
        constant(k);
    }
}
```

2. public static void barsRearranged(int n) {
    for (int i = 1; i <= n; i *= 2) {
        for (int j = 0; j < i; j += 1) {
            System.out.println("mooove");
        }
    }
}
3 A Bit on Bits

Complete the following two functions.

/** Returns whether the ith bit of num is a 1 or not. i = 0 represents
* the least significant bit, i = 1 represents the bit to the left
* of that, and so on.
* For example, if num = 2, then i = 0 for it is not on but i = 1 is
* on since 2 in binary is 10. */
public static boolean isBitOn(int num, int i) {
    int mask = 1 ________________________________;
    return ________________________________;
}

/** Returns the input number but with its ith bit changed to a 1. Again,
* i = 0 represents the least significant bit, i = 1 represents the bit
* to the left of that, and so on.
* For example, if num = 1, which in binary is 01, then turning
* its i = 1 bit on would result in the binary number 11, which is 3. */
public static int turnBitOn(int num, int i) {
    int mask = 1 ________________________________;
    return ________________________________;
}
Extra: A Bit with some Bits

Complete the following method. When given a list of integers, `bitVote` returns an integer such that the \(i^{th}\) bit of the return value is 1 if and only if more than half of the integers in the list have 1 in the \(i^{th}\) bit. Keep in mind that Java `int` s are 32 bits long!

For example, if `bitList` was \([1,3]\), then in binary this would be \([(01)_2, (11)_2]\) (with 30 more zeros in front of each number), and the result would be \((01)_2 \implies 1\), since the rightmost digit was 1 for more than half the numbers, but the second-from-the-right digit was not 1 for more than half the numbers.

Note: the solution to this question isn’t very complicated, but it’s not short! Try breaking it down into components, and ask your neighbors for help!

```java
public static int bitVote(int[] bitList) {

    for (int i = 0; i < 32; i++) { // For each bit index

        for (int k : bitList) { // For each integer

        }

    }

}
```
