Problem. Print out the command-line arguments in lexicographic order:

% java sort the quick brown fox jumped over the lazy dog
brown dog fox jumped lazy over quick the the

Plan.

```java
public class Sort {
    /** Sort and print WORDS lexicographically. */
    public static void main(String[] words) {
        sort(words, 0, words.length-1);
        print(words);
    }

    /** Sort items A[L..U], with all others unchanged. */
    static void sort(String[] A, int L, int U) { /* "TOMORROW" */ }

    /** Print A on one line, separated by blanks. */
    static void print(String[] A) { /* "TOMORROW" */ }
}
```
How do We Know If It Works?

- **Unit testing** refers to the testing of individual units (methods, classes) within a program, rather than the whole program.
- In this class, we mainly use the JUnit tool for unit testing.
- **Example:** `AGTestYear.java` in lab #1.
- **Integration testing** refers to the testing of entire (integrated) set of modules—the whole program.
- In this course, we’ll look at various ways to run the program against prepared inputs and checking the output.
- **Regression testing** refers to testing with the specific goal of checking that fixes, enhancements, or other changes have not introduced faults (regressions).
Test-Driven Development

- Idea: write tests first.
- Implement unit at a time, run tests, fix and refactor until it works.
- We’re not really going to push it in this course, but it is useful and has quite a following.
Testing sort

- This is pretty easy: just give a bunch of arrays to sort and then make sure they each get sorted properly.

- Have to make sure we cover the necessary cases:
  - Corner cases. E.g., empty array, one-element, all elements the same.
  - Representative “middle” cases. E.g., elements reversed, elements in order, one pair of elements reversed, . . . .
Simple JUnit

• The JUnit package provides some handy tools for unit testing.

• The Java annotation @Test on a method tells the JUnit machinery to call that method.

• (An annotation in Java provides information about a method, class, etc., that can be examined within Java itself.)

• A collection of methods with names beginning with assert then allow your test cases to check conditions and report failures.

• [See example.]
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = /*( Index s.t. A[k] is largest in A[L],...,A[U] )*/;
        /*{ Sort items L to U-1 of A. }*/;
    }
}

And we're done! Well, OK, not quite.
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = indexOfLargest(A, L, U);
        /*{ Sort items L to U-1 of A. }*/;
    }
}

/** Index k, I0<=k<=I1, such that V[k] is largest element among
 * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    ...
}
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = indexOfLargest(A, L, U);
        sort(A, L, U-1);  // Sort items L to U-1 of A
    }
}

/** Index k, I0<=k<=I1, such that V[k] is largest element among
 * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    ...
}
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = indexOfLargest(A, L, U);
        sort(A, L, U-1);  // Sort items L to U-1 of A
    }
}

/** Index k, I0<=k<=I1, such that V[k] is largest element among
 * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    ...
}
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = indexOfLargest(A, L, U);
        sort(A, L, U-1); // Sort items L to U-1 of A
    }
}

What would an iterative version look like?

    while (?) {
        ?
    }
Selection Sort

/** Sort items A[L..U], with all others unchanged. */
static void sort(String[] A, int L, int U) {
    if (L < U) {
        int k = indexOfLargest(A, L, U);
        sort(A, L, U-1);  // Sort items L to U-1 of A
    }
}

Iterative version:

    while (L < U) {
        int k = indexOfLargest(A, L, U);
        U -= 1;
    }
/** Index k, I0<=k<=I1, such that V[k] is largest element among
 * V[I0], ... V[I1]. Requires I0<=I1. */

static int indexOfLargest(String[] V, int i0, int i1) {
    if (?)
        return i1;
    else {

    }
}

Find Largest

/** Index k, I0\leq k\leq I1, such that V[k] is largest element among * V[I0], ..., V[I1]. Requires I0\leq I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {

    }
}

/** Index k, I0<=k<=I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0<=I1. */  
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {
        int k = /*( index of largest value in V[i0 + 1..i1] )*/;
        return /*( whichever of i0 and k has larger value )*/;
    }
}
Find Largest

/** Index k, I0\leq k \leq I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0\leq I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {
        int k = indexOfLargest(V, i0 + 1, i1);
        return /*( whichever of i0 and k has larger value )*/;
    }
}
Find Largest

/** Index k, I0<=k<=I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {
        int k = indexOfLargest(V, i0 + 1, i1);
        return (V[i0].compareTo(V[k]) > 0) ? i0 : k;
        // if (V[i0].compareTo(V[k]) > 0) return i0; else return k;
    }
}

• Turning this into an iterative version is tricky: not tail recursive.
• What are the arguments to compareTo the first time it's called?
Iteratively Find Largest

/** Value k, I0<=k<=I1, such that V[k] is largest element among
 * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
    return i1;

    else /* if (i0 < i1) */ {
    int k = indexOfLargest(V, i0 + 1, i1);
    return (V[i0].compareTo(V[k]) > 0) ? i0 : k;
    // if (V[i0].compareTo(V[k]) > 0) return i0; else return k;
    }
}

Iterative:

int i, k;

k = ?;  // Deepest iteration
for (i = ?; ...?; i ...?)
    k = ?;
return k;
Iteratively Find Largest

/** Value k, I0<=k<=I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
  if (i0 >= i1)
    return i1;
  else /* if (i0 < i1) */ {
    int k = indexOfLargest(V, i0 + 1, i1);
    return (V[i0].compareTo(V[k]) > 0) ? i0 : k;
    // if (V[i0].compareTo(V[k]) > 0) return i0; else return k;
  }
}

Iterative:

int i, k;

k = i1;  // Deepest iteration
for (i = ?; ...?; i ...?)
  k = ?;
return k;
Iteratively Find Largest

/** Value k, I0<=k<=I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {
        int k = indexOfLargest(V, i0 + 1, i1);
        return (V[i0].compareTo(V[k]) > 0) ? i0 : k;
    }
}

Iterative:

int i, k;

k = i1;  // Deepest iteration
for (i = i1 - 1; i >= i0; i -= 1)
    k = ?;
return k;
Iteratively Find Largest

/** Value k, I0<=k<=I1, such that V[k] is largest element among * V[I0], ... V[I1]. Requires I0<=I1. */

static int indexOfLargest(String[] V, int i0, int i1) {
    if (i0 >= i1)
        return i1;
    else /* if (i0 < i1) */ {
        int k = indexOfLargest(V, i0 + 1, i1);
        return (V[i0].compareTo(V[k]) > 0) ? i0 : k;
        // if (V[i0].compareTo(V[k]) > 0) return i0; else return k;
    }
}

Iterative:

int i, k;

k = i1; // Deepest iteration
for (i = i1 - 1; i >= i0; i -= 1)
    k = (V[i].compareTo(V[k]) > 0) ? i : k;
return k;
Finally, Printing

/** Print A on one line, separated by blanks. */
static void print(String[] A) {
    for (int i = 0; i < A.length; i += 1)
        System.out.print(A[i] + " ");
    System.out.println();
}

/* Java also provides a simple, specialized syntax for looping
 * through an entire array: */
for (String s : A)
    System.out.print(s + " ");
Another Problem

Given an array of integers, A, of length \( N > 0 \), find the smallest index, \( k \), such that all elements at indices \( \geq k \) and \( < N - 1 \) are greater than \( A[N - 1] \). Then rotate elements \( k \) to \( N - 1 \) right by one. For example, if A starts out as

\[
\{ 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, 12 \}
\]

then it ends up as

\[
\{ 1, 9, 4, 3, 0, 12, 11, 9, 12, 15, 22 \}
\]

As another example,

\[
\{ 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, -2 \}
\]

would become

\[
\{ -2, 1, 9, 4, 3, 0, 12, 11, 9, 15, 22 \}
\]

What if A starts like this?

\[
\{ 1, 9, 4, 3, 0, 12, 11, 9, 12, 15, 22 \}
\]
Another Problem

Given an array of integers, $A$, of length $N > 0$, find the smallest index, $k$, such that all elements at indices $\geq k$ and $< N - 1$ are greater than $A[N - 1]$. Then rotate elements $k$ to $N - 1$ right by one. For example, if $A$ starts out as

$$\{ 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, 12 \}$$

then it ends up as

$$\{ 1, 9, 4, 3, 0, 12, 11, 9, 12, 15, 22 \}$$

As another example,

$$\{ 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, -2 \}$$

would become

$$\{ -2, 1, 9, 4, 3, 0, 12, 11, 9, 15, 22 \}$$

What if $A$ starts like this?

$$\{ 1, 9, 4, 3, 0, 12, 11, 9, 12, 15, 22 \}$$

Answer: It’s unchanged. (No, the spec is not ambiguous.)
public class Shove {

    /** Rotate elements A[k] to A[A.length-1] one element to the right, where k is the smallest index such that elements k through A.length-2 are all larger than A[A.length-1]. */
    static void moveOver(int[] A) {
        // FILL IN
    }
}
