Apple's iPad, day 2 ⇒ After the dust has settled, what do we have? Name causes chuckles & lawsuits (Fujitsu). "Haters" say nothing new, closed system.

CS61C L05 Introduction to C (pt 3) (1)

Garcia, Spring 2010 © UCB

- Pointers and arrays are virtually same
- C knows how to increment pointers
- C is an efficient language, with little protection
 - Array bounds not checked
 - Variables not automatically initialized
- (Beware) The cost of efficiency is more overhead for the programmer.
 - "C gives you a lot of extra rope but be careful not to hang yourself with it!"

Pointers (1/4)

...review...

y = 5

- Sometimes you want to have a procedure increment a variable?
- What gets printed?

void AddOne(int x)
{ x = x + 1; }
int y = 5;
AddOne(y);
printf("y = %d\n", y);

Pointers (2/4)

...review...

- Solved by passing in a pointer to our subroutine.
- Now what gets printed?

Pointers (3/4)

- But what if what you want changed is a pointer?
- What gets printed?

Pointers (4/4)

- Solution! Pass a pointer to a pointer, declared as **h
- Now what gets printed?

void IncrementPtr(int **h) *q = 60
{ *h = *h + 1; }
int A[3] = {50, 60, 70};
int *q = A;
IncrementPtr(&q);
printf("*q = %d\n", *q);

Dynamic Memory Allocation (1/4)

- C has operator sizeof() which gives size in bytes (of type or variable)
- Assume size of objects can be misleading and is bad style, so use sizeof(type)
 - Many years ago an int was 16 bits, and programs were written with this assumption.
 - What is the size of integers now?
- "sizeof" knows the size of arrays:

int ar[3]; // Or: int ar[] = $\{54, 47, 99\}$ sizeof(ar) $\Rightarrow 12$

• ...as well for arrays whose size is determined at run-time:

```
int n = 3;
int ar[n]; // Or: int ar[fun_that_returns_3()];
sizeof(ar) ⇒ 12
```

Dynamic Memory Allocation (2/4)

 To allocate room for something new to point to, use malloc() (with the help of a typecast and sizeof):

ptr = (int *) malloc (sizeof(int));

- Now, ptr points to a space somewhere in memory of size (sizeof(int)) in bytes.
- (int *) simply tells the compiler what will go into that space (called a typecast).
- malloc is almost never used for 1 var

ptr = (int *) malloc (n*sizeof(int));

• This allocates an array of n integers.

Dynamic Memory Allocation (3/4)

- Once malloc() is called, the memory location contains garbage, so don't use it until you've set its value.
- After dynamically allocating space, we must dynamically free it:

free(ptr);

• Use this command to clean up.

• Even though the program frees all memory on exit (or when main returns), don't be lazy!

• You never know when your main will get transformed into a subroutine!

Dynamic Memory Allocation (4/4)

- The following two things will cause your program to crash or behave strangely later on, and cause VERY VERY hard to figure out bugs:
 - free () ing the same piece of memory twice
 - calling free () on something you didn't get back from malloc ()
- The runtime <u>does not</u> check for these mistakes
 - Memory allocation is so performance-critical that there just isn't time to do this
 - The usual result is that you corrupt the memory allocator's internal structure

• You won't find out until much later on, in a totally unrelated part of your code!

Arrays not implemented as you'd think

```
void foo() {
 int *p, *q, x;
 int a[4];
 p = (int *) malloc (sizeof(int));
 q = \&x;
 *p = 1; // p[0] would also work here
 printf("*p:%u, p:%u, &p:%u\n", *p, p, &p);
 *q = 2; // q[0] would also work here
 printf("*q:<sup>§</sup>u, q:<sup>§</sup>u, &q:<sup>§</sup>u\n", *q, q, &q);
 *a = 3; // a[0] would also work here
 printf("*a:%u, a:%u, &a:%u\n", *a, a, &a);
          4 8 12 16 20 24 28 32 36 40 44 48 52 56 60 ...
       0
               40 20 2
                        3
                                     1
                                                    . . .
}
                                    unnamed-malloc-space
                   D.
                      X
                   *p:1, p:40, &p:12
                   *q:2, q:20, &q:16
                   *a:3, a:24, &a:24
           K&R: "An array name is not a variable"
                                                    Garcia, Spring 2010 © UCB

Peer Instruction

Which are guaranteed to print out 5?

```
I: main() {
     int *a-ptr = (int *)malloc(int);
     *a-ptr = 5;
     printf("%d", *a-ptr);
   }
II:main() {
     int *p, a = 5;
     p = &a; ...
/* code; a,p NEVER on LEFT of = */
     printf("%d", a);
                                            II
   }
                                   a)
                                   b)
                                           YES
                                     YES
                                      YES
                                           YES
                                      No idea
```

Garcia, Spring 2010 © UCB

"And in Conclusion..."

- Use handles to change pointers
- Create abstractions with structures
- Dynamically allocated heap memory must be manually deallocated in C.
 - Use malloc() and free() to allocate and deallocate memory from heap.

Reference slides

You ARE responsible for the material on these slides (they're just taken from the reading anyway); we've moved them to the end and off-stage to give more breathing room to lecture!

Garcia, Spring 2010 © UCB

C structures : **Overview**

- A struct is a data structure composed from simpler data types.
 - Like a class in Java/C++ but without methods or inheritance.

```
struct point { /* type definition */
    int x;
    int y;
};
```

```
void PrintPoint(struct point p)
{ As always in C, the argument is passed by "value" - a copy is made.
        printf("(%d,%d)", p.x, p.y);
}
```

```
struct point p1 = {0,10}; /* x=0, y=10 */
```

```
CS61C L05 Introduction to C (pt 3) (17)
```

C structures: Pointers to them

- Usually, more efficient to pass a pointer to the struct.
- The C arrow operator (->) dereferences and extracts a structure field with a single operator.
- The following are equivalent:

struct point *p;
 /* code to assign to pointer */
printf("x is %d\n", (*p).x);
printf("x is %d\n", p->x);

How big are structs?

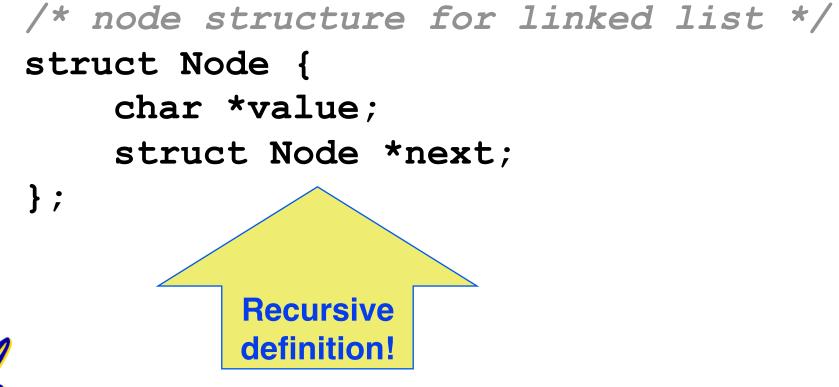

- Recall C operator sizeof() which gives size in bytes (of type or variable)
- •How big is sizeof(p)?

```
struct p {
    char x;
    int y;
};
```

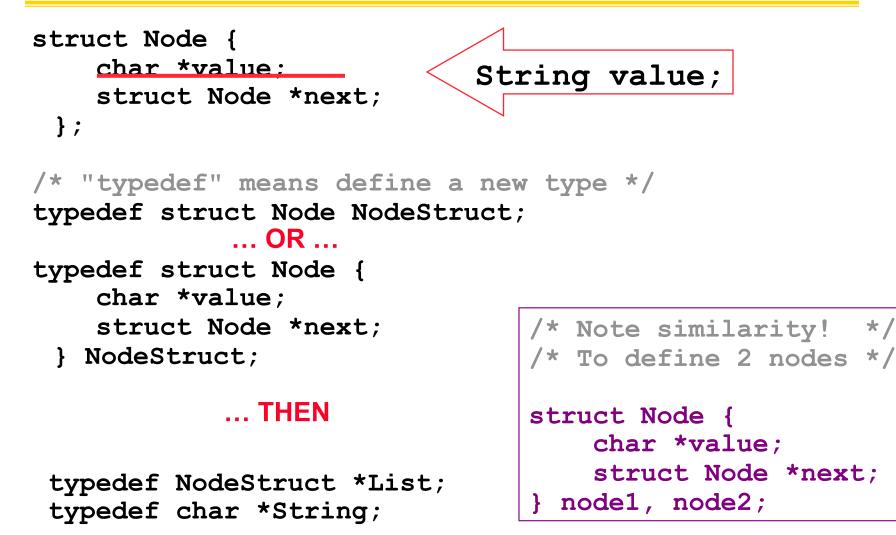

- 5 bytes? 8 bytes?
- Compiler may word align integer y

• Let's look at an example of using structures, pointers, malloc(), and free() to implement a linked list of strings.

typedef simplifies the code

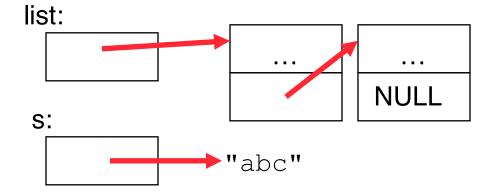

```
/* Add a string to an existing list */
List cons(String s, List list)
ł
  List node = (List) malloc(sizeof(NodeStruct));
  node->value = (String) malloc (strlen(s) + 1);
  strcpy(node->value, s);
  node->next = list;
  return node;
}
   <u>String s1 = "abc", s2 = "cde";</u>
   List theList = NULL;
   theList = cons(s2, theList);
   theList = cons(s1, theList);
/* or, just like (cons s1 (cons s2 nil)) */
   theList = cons(s1, cons(s2, NULL));
```

```
/* Add a string to an existing list, 2nd call */
List cons(String s, List list)
{
   List node = (List) malloc(sizeof(NodeStruct));
   node->value = (String) malloc (strlen(s) + 1);
   strcpy(node->value, s);
   node->next = list;
   return node;
}
```

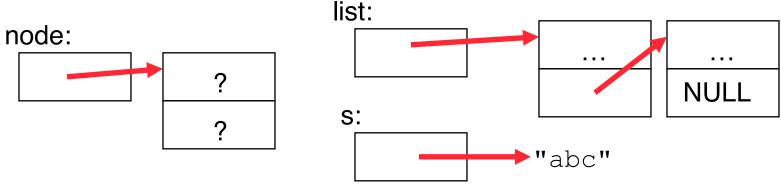

node:
