$$

$$
\operatorname{Pr}[\text { Other } \mid \text { High Fever }]=\frac{0.85 \times 0.1}{0.15 \times 0.80+10^{-8} \times 1+0.85 \times 0.1} \approx 0.42
$$

## Why do you have a fever?

Using Bayes' rule, we find

$$
\begin{aligned}
\operatorname{Pr}[\text { Flu } \mid \text { High Fever }] & =\frac{0.15 \times 0.80}{0.15 \times 0.80+10^{-8} \times 1+0.85 \times 0.1} \approx 0.58 \\
\operatorname{Pr}[\text { Ebola } \mid \text { High Fever }] & =\frac{10^{-8} \times 1}{0.15 \times 0.80+10^{-8} \times 1+0.85 \times 0.1} \approx 5 \times 10^{-8} \\
\operatorname{Pr}[\text { Other } \mid \text { High Fever }] & =\frac{0.85 \times 0.1}{0.15 \times 0.80+10^{-8} \times 1+0.85 \times 0.1} \approx 0.42
\end{aligned}
$$

The values $0.58,5 \times 10^{-8}, 0.42$ are the posterior probabilities.

Why do you have a fever?

## Why do you have a fever?

## Why do you have a fever?

Our "Bayes' Square" picture:

## Why do you have a fever?

Our "Bayes' Square" picture:

Note that even though $\operatorname{Pr}[$ Fever $\mid$ Ebola $]=1$,

## Why do you have a fever?

Our "Bayes' Square" picture:

Note that even though $\operatorname{Pr}[$ Fever $\mid$ Ebola $]=1$, one has

$$
\operatorname{Pr}[\text { Ebola|Fever }] \approx 0 .
$$

## Why do you have a fever?

Our "Bayes' Square" picture:

Note that even though $\operatorname{Pr}[$ Fever $\mid$ Ebola $]=1$, one has

$$
\operatorname{Pr}[\text { Ebola|Fever }] \approx 0 .
$$

This example shows the importance of the prior probabilities.

## Why do you have a fever?

We found

## Why do you have a fever?

We found
$\operatorname{Pr}[$ Flu $\mid$ High Fever $] \approx 0.58$,
$\operatorname{Pr}[$ Ebola|High Fever $] \approx 5 \times 10^{-8}$,
$\operatorname{Pr}[$ Other $\mid$ High Fever $] \approx 0.42$

## Why do you have a fever?

We found

$$
\begin{aligned}
& \operatorname{Pr}[\text { Flu } \mid \text { High Fever }] \approx 0.58, \\
& \operatorname{Pr}[\text { Ebola } \mid \text { High Fever }] \approx 5 \times 10^{-8}, \\
& \operatorname{Pr}[\text { Other } \mid \text { High Fever }] \approx 0.42
\end{aligned}
$$

One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.

## Why do you have a fever?

We found
$\operatorname{Pr}[$ Flu $\mid$ High Fever $] \approx 0.58$,
$\operatorname{Pr}[$ Ebola $\mid$ High Fever $] \approx 5 \times 10^{-8}$,
$\operatorname{Pr}[$ Other $\mid$ High Fever $] \approx 0.42$

One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.
'Ebola' is the Maximum Likelihood Estimate (MLE) of the cause: it causes the fever with the largest probability.

## Why do you have a fever?

We found
$\operatorname{Pr}[$ Flu $\mid$ High Fever $] \approx 0.58$,
$\operatorname{Pr}[$ Ebola $\mid$ High Fever $] \approx 5 \times 10^{-8}$,
$\operatorname{Pr}[$ Other $\mid$ High Fever $] \approx 0.42$

One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.
'Ebola' is the Maximum Likelihood Estimate (MLE) of the cause: it causes the fever with the largest probability.
Recall that

$$
p_{m}=\operatorname{Pr}\left[A_{m}\right], q_{m}=\operatorname{Pr}\left[B \mid A_{m}\right], \operatorname{Pr}\left[A_{m} \mid B\right]=\frac{p_{m} q_{m}}{p_{1} q_{1}+\cdots+p_{M} q_{M}}
$$

## Why do you have a fever?

We found
$\operatorname{Pr}[$ Flu $\mid$ High Fever $] \approx 0.58$,
$\operatorname{Pr}[$ Ebola $\mid$ High Fever $] \approx 5 \times 10^{-8}$,
$\operatorname{Pr}[$ Other $\mid$ High Fever $] \approx 0.42$

One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.
'Ebola' is the Maximum Likelihood Estimate (MLE) of the cause: it causes the fever with the largest probability.
Recall that

$$
p_{m}=\operatorname{Pr}\left[A_{m}\right], q_{m}=\operatorname{Pr}\left[B \mid A_{m}\right], \operatorname{Pr}\left[A_{m} \mid B\right]=\frac{p_{m} q_{m}}{p_{1} q_{1}+\cdots+p_{M} q_{M}}
$$

Thus,

- MAP $=$ value of $m$ that maximizes $p_{m} q_{m}$.

## Why do you have a fever?

We found
$\operatorname{Pr}[$ Flu $\mid$ High Fever $] \approx 0.58$,
$\operatorname{Pr}[$ Ebola $\mid$ High Fever $] \approx 5 \times 10^{-8}$,
$\operatorname{Pr}[$ Other $\mid$ High Fever $] \approx 0.42$

One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.
'Ebola' is the Maximum Likelihood Estimate (MLE) of the cause: it causes the fever with the largest probability.
Recall that

$$
p_{m}=\operatorname{Pr}\left[A_{m}\right], q_{m}=\operatorname{Pr}\left[B \mid A_{m}\right], \operatorname{Pr}\left[A_{m} \mid B\right]=\frac{p_{m} q_{m}}{p_{1} q_{1}+\cdots+p_{M} q_{M}}
$$

Thus,

- MAP $=$ value of $m$ that maximizes $p_{m} q_{m}$.
- MLE $=$ value of $m$ that maximizes $q_{m}$.

$\left(A_{1}, B\right)$ are not independent: $\operatorname{Pr}\left[A_{1} \mid B\right]=\frac{0.1}{0.5}=0.2 \neq \operatorname{Pr}\left[A_{1}\right]=0.25$.

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $H^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $H^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $H^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

$A, C$ are independent;

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $H^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

$A, C$ are independent; $B, C$ are independent;

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $\mathrm{H}^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

$A, C$ are independent; $B, C$ are independent; $A \cap B, C$ are not independent.

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $\mathrm{H}^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

$A, C$ are independent; $B, C$ are independent; $A \cap B, C$ are not independent. $(\operatorname{Pr}[A \cap B \cap C]=0 \neq \operatorname{Pr}[A \cap B] \operatorname{Pr}[C]$.

## Pairwise Independence

Flip two fair coins. Let

- $A=$ 'first coin is $\mathrm{H}^{\prime}=\{H T, H H\}$;
- $B=$ 'second coin is $H^{\prime}=\{T H, H H\}$;
- $C=$ 'the two coins are different' $=\{T H, H T\}$.

$A, C$ are independent; $B, C$ are independent;
$A \cap B, C$ are not independent. $(\operatorname{Pr}[A \cap B \cap C]=0 \neq \operatorname{Pr}[A \cap B] \operatorname{Pr}[C]$.)
If $A$ did not say anything about $C$ and $B$ did not say anything about $C$, then $A \cap B$ would not say anything about $C$.

## Example 2

Flip a fair coin 5 times.

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.
Then,
$A_{m}, A_{n}$ are independent for all $m \neq n$.

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.
Then,

$$
A_{m}, A_{n} \text { are independent for all } m \neq n .
$$

Also,
$A_{1}$ and $A_{3} \cap A_{5}$ are independent.

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.
Then,
$A_{m}, A_{n}$ are independent for all $m \neq n$.
Also,
$A_{1}$ and $A_{3} \cap A_{5}$ are independent.
Indeed,

$$
\operatorname{Pr}\left[A_{1} \cap\left(A_{3} \cap A_{5}\right)\right]=\frac{1}{8}=\operatorname{Pr}\left[A_{1}\right] \operatorname{Pr}\left[A_{3} \cap A_{5}\right]
$$

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.
Then,
$A_{m}, A_{n}$ are independent for all $m \neq n$.
Also,
$A_{1}$ and $A_{3} \cap A_{5}$ are independent.
Indeed,

$$
\operatorname{Pr}\left[A_{1} \cap\left(A_{3} \cap A_{5}\right)\right]=\frac{1}{8}=\operatorname{Pr}\left[A_{1}\right] \operatorname{Pr}\left[A_{3} \cap A_{5}\right]
$$

. Similarly,
$A_{1} \cap A_{2}$ and $A_{3} \cap A_{4} \cap A_{5}$ are independent.

## Example 2

Flip a fair coin 5 times. Let $A_{n}=$ 'coin $n$ is $\mathrm{H}^{\prime}$, for $n=1, \ldots, 5$.
Then,
$A_{m}, A_{n}$ are independent for all $m \neq n$.
Also,
$A_{1}$ and $A_{3} \cap A_{5}$ are independent.
Indeed,

$$
\operatorname{Pr}\left[A_{1} \cap\left(A_{3} \cap A_{5}\right)\right]=\frac{1}{8}=\operatorname{Pr}\left[A_{1}\right] \operatorname{Pr}\left[A_{3} \cap A_{5}\right]
$$

. Similarly,
$A_{1} \cap A_{2}$ and $A_{3} \cap A_{4} \cap A_{5}$ are independent.
This leads to a definition ....

## Mutual Independence

Theorem
If the events $\left\{A_{j}, j \in J\right\}$ are mutually independent and if $K_{1}$ and $K_{2}$ are disjoint finite subsets of $J$, then any event $V_{1}$ defined by $\left\{A_{j}, j \in K_{1}\right\}$ is independent of any event $V_{2}$ defined by $\left\{A_{j}, j \in K_{2}\right\}$.

## Mutual Independence

Theorem
If the events $\left\{A_{j}, j \in J\right\}$ are mutually independent and if $K_{1}$ and $K_{2}$ are disjoint finite subsets of $J$, then any event $V_{1}$ defined by $\left\{A_{j}, j \in K_{1}\right\}$ is independent of any event $V_{2}$ defined by $\left\{A_{j}, j \in K_{2}\right\}$.
(b) More generally, if the $K_{n}$ are pairwise disjoint finite subsets of $J$, then events $V_{n}$ defined by $\left\{A_{j}, j \in K_{n}\right\}$ are mutually independent.

## Mutual Independence

Theorem
If the events $\left\{A_{j}, j \in J\right\}$ are mutually independent and if $K_{1}$ and $K_{2}$ are disjoint finite subsets of $J$, then any event $V_{1}$ defined by $\left\{A_{j}, j \in K_{1}\right\}$ is independent of any event $V_{2}$ defined by $\left\{A_{j}, j \in K_{2}\right\}$.
(b) More generally, if the $K_{n}$ are pairwise disjoint finite subsets of $J$, then events $V_{n}$ defined by $\left\{A_{j}, j \in K_{n}\right\}$ are mutually independent.

## Proof:

See Lecture Note 25, Example 2.7.

## Mutual Independence

## Theorem

If the events $\left\{A_{j}, j \in J\right\}$ are mutually independent and if $K_{1}$ and $K_{2}$ are disjoint finite subsets of $J$, then any event $V_{1}$ defined by $\left\{\boldsymbol{A}_{j}, j \in K_{1}\right\}$ is independent of any event $V_{2}$ defined by $\left\{A_{j}, j \in K_{2}\right\}$.
(b) More generally, if the $K_{n}$ are pairwise disjoint finite subsets of $J$, then events $V_{n}$ defined by $\left\{A_{j}, j \in K_{n}\right\}$ are mutually independent.

## Proof:

See Lecture Note 25, Example 2.7.
For instance, the fact that there are more heads than tails in the first five flips of a coin is independent of the fact there are fewer heads than tails in flips $6, \ldots, 13$.

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem. Fact

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem. Fact
Assume $A, B, C, \ldots, G, H$ are mutually independent.

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem. Fact
Assume $A, B, C, \ldots, G, H$ are mutually independent. Then, $A, B^{C}, C, \ldots, G^{C}, H$ are mutually independent.

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem. Fact
Assume $A, B, C, \ldots, G, H$ are mutually independent. Then, $A, B^{C}, C, \ldots, G^{C}, H$ are mutually independent.
Proof:

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem.

## Fact

Assume $A, B, C, \ldots, G, H$ are mutually independent.
Then, $A, B^{C}, C, \ldots, G^{c}, H$ are mutually independent.
Proof:
We show that
$\operatorname{Pr}\left[A \cap B^{c} \cap C \cap \cdots \cap G^{c} \cap H\right]=\operatorname{Pr}[A] \operatorname{Pr}\left[B^{c}\right] \cdots \operatorname{Pr}\left[G^{c}\right] \operatorname{Pr}[H]$.

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem.
Fact
Assume $A, B, C, \ldots, G, H$ are mutually independent.
Then, $A, B^{C}, C, \ldots, G^{C}, H$ are mutually independent.

## Proof:

We show that
$\operatorname{Pr}\left[A \cap B^{c} \cap C \cap \cdots \cap G^{c} \cap H\right]=\operatorname{Pr}[A] \operatorname{Pr}\left[B^{c}\right] \cdots \operatorname{Pr}\left[G^{c}\right] \operatorname{Pr}[H]$.
Assume that this is true when there are at most $n$ complements.

## Mutual Independence: Complements

Here is one step in the proof of the previous theorem.
Fact
Assume $A, B, C, \ldots, G, H$ are mutually independent.
Then, $A, B^{C}, C, \ldots, G^{C}, H$ are mutually independent.
Proof:
We show that
$\operatorname{Pr}\left[A \cap B^{c} \cap C \cap \cdots \cap G^{c} \cap H\right]=\operatorname{Pr}[A] \operatorname{Pr}\left[B^{c}\right] \cdots \operatorname{Pr}\left[G^{c}\right] \operatorname{Pr}[H]$.
Assume that this is true when there are at most $n$ complements.
Base case: $n=0$ true by definition of mutual independence.

## Mutual Independence: Complements
