- For any subset of n+k pts,
 - 1. there is unique degree n-1 polynomial Q(x) that fits n of them
 - 2. and where Q(x) is consistent with n+k points $\implies P(x) = Q(x)$.

Brute Force:

For each subset of n+k points Fit degree n-1 polynomial, Q(x), to n of them. Check if consistent with n+k of the total points. If yes, output Q(x).

- For subset of n+k pts where R(i) = P(i), method will reconstruct P(x)!
- For any subset of n+k pts,
 - 1. there is unique degree n-1 polynomial Q(x) that fits n of them
 - 2. and where Q(x) is consistent with n+k points $\implies P(x) = Q(x)$.

Reconstructs P(x) and only P(x)!!

Idea: Multiply equation i by 0 if and only if $P(i) \neq R(i)$. All equations satisfied!!!!!

But which equations should we multiply by 0? Where oh where...??

We will use a polynomial!!! That we don't know. But can find!

Errors at points e_1, \ldots, e_k . (In diagram above, $e_1 = 2$.)

Error locator polynomial: $E(x) = (x - e_1)(x - e_2) \dots (x - e_k)$.

E(i) = 0 if and only if $e_i = i$ for some j

Multiply equations by $E(\cdot)$. (Above E(x) = (x-2).)

Is there one and only one P(x) from Berlekamp-Welsh procedure?

Hmmm...

Is there one and only one P(x) from Berlekamp-Welsh procedure?

Existence: there is a P(x) and E(x) that satisfy equations.

Uniqueness: any solution Q'(x) and E'(x) have

$$\frac{Q'(x)}{E'(x)} = \frac{Q(x)}{E(x)} = P(x). \tag{1}$$

Uniqueness: any solution Q'(x) and E'(x) have

$$\frac{Q'(x)}{E'(x)} = \frac{Q(x)}{E(x)} = P(x). \tag{1}$$
