Lecture 7. Outline.

- Modular Arithmetic. Clock Math!!!
- Inverses for Modular Arithmetic: Greatest Common Divisor. Division!!!
- 3. Euclid's GCD Algorithm.
 A little tricky here!

Clock Math

If it is 1:00 now.

What time is it in 2 hours? 3:00!

What time is it in 5 hours? 6:00!

What time is it in 15 hours? 16:00!

Actually 4:00.

16 is the "same as 4" with respect to a 12 hour clock system. Clock time equivalent up to to addition/subtraction of 12.

What time is it in 100 hours? 101:00! or 5:00.

$$101 = 12 \times 8 + 5$$
.

5 is the same as 101 for a 12 hour clock system.

Clock time equivalent up to addition of any integer multiple of 12.

Custom is only to use the representative in $\{12,1,\ldots,11\}$ (Almost remainder, except for 12 and 0 are equivalent.)

Day of the week.

Today is Monday.

What day is it a year from now? on February 9, 2016?

Number days.

0 for Sunday, 1 for Monday, ..., 6 for Saturday.

Today: day 2.

5 days from now. day 7 or day 0 or Sunday.

25 days from now. day 27 or day 6.

two days are equivalent up to addition/subtraction of multiple of 7.

11 days from now is day 6 which is Saturday!

What day is it a year from now?

This year is not a leap year. So 365 days from now.

Day 2+365 or day 367.

Smallest representation:

subtract 7 until smaller than 7.

divide and get remainder.

367/7 leaves quotient of 52 and remainder 3.

or February 7, 2018 is a Wednesday.

Years and years...

80 years from now? 20 leap years. 366×20 days 60 regular years. 365×60 days Today is day 2.

It is day $2+366 \times 20+365 \times 60$. Equivalent to?

Hmm.

What is remainder of 366 when dividing by $7?\ 52 \times 7 + 2$. What is remainder of 365 when dividing by $7?\ 1$ Today is day 2.

Get Day: $2+2\times20+1\times60=102$

Remainder when dividing by 7? $102 = 14 \times 7 + 4$.

Or February 7, 2096 is Thursday!

Further Simplify Calculation:

20 has remainder 6 when divided by 7.

60 has remainder 4 when divided by 7.

Get Day: $2 + 2 \times 6 + 1 \times 4 = 18$.

Or Day 4. February 9, 2095 is Thursday.

"Reduce" at any time in calculation!

Modular Arithmetic: refresher.

```
x is congruent to y modulo m or "x \equiv y \pmod{m}" if and only if (x - y) is divisible by m. ...or x and y have the same remainder w.r.t. m. ...or x = y + km for some integer k.
```

Mod 7 equivalence classes:

$$\{\ldots, -7, 0, 7, 14, \ldots\} \quad \{\ldots, -6, 1, 8, 15, \ldots\} \ \ldots$$

Useful Fact: Addition, subtraction, multiplication can be done with any equivalent *x* and *y*.

or "
$$a \equiv c \pmod{m}$$
 and $b \equiv d \pmod{m}$
 $\implies a + b \equiv c + d \pmod{m}$ and $a \cdot b = c \cdot d \pmod{m}$ "

Proof: If $a \equiv c \pmod{m}$, then a = c + km for some integer k. If $b \equiv d \pmod{m}$, then b = d + jm for some integer j. Therefore, a + b = c + d + (k + j)m and since k + j is integer. $\implies a + b \equiv c + d \pmod{m}$.

Can calculate with representative in $\{0, ..., m-1\}$.

Notation

```
x \pmod{m} or \pmod{(x,m)}
        - remainder of x divided by m in \{0, ..., m-1\}.
 mod(x, m) = x - |\frac{x}{m}|m
  \left|\frac{x}{m}\right| is quotient.
 mod(29,12) = 29 - (|\frac{29}{12}|) \times 12 = 29 - (2) \times 12 = 4 = 5
Work in this system.
 a \equiv b \pmod{m}.
Says two integers a and b are equivalent modulo m.
Modulus is m
6 \equiv 3 + 3 \equiv 3 + 10 \pmod{7}.
6 = 3 + 3 = 3 + 10 \pmod{7}.
Generally, not 6 \pmod{7} = 13 \pmod{7}.
 But ok, if you really want.
```

Inverses and Factors.

Division: multiply by multiplicative inverse.

$$2x = 3 \implies \left(\frac{1}{2}\right) \cdot 2x = \left(\frac{1}{2}\right) \cdot 3 \implies x = \frac{3}{2}.$$

Multiplicative inverse of x is y where xy = 1; 1 is multiplicative identity element.

In modular arithmetic, 1 is the multiplicative identity element.

Multiplicative inverse of $x \mod m$ is $y \mod m$.

For 4 modulo 7 inverse is 2: $2 \cdot 4 \equiv 8 \equiv 1 \pmod{7}$.

Greatest Common Divisor and Inverses.

Thm:

If greatest common divisor of x and m, gcd(x, m), is 1, then x has a multiplicative inverse modulo m.

```
Proof \Longrightarrow: The set S = \{0x, 1x, ..., (m-1)x\} contains y \equiv 1 \mod m if all distinct modulo m.
```

Pigenhole principle: Each of m numbers in S correspond to different one of m equivalence classes modulo m.

 \implies One must correspond to 1 modulo m.

```
If not distinct, then \exists a, b \in \{0, ..., m-1\}, a \neq b, where (ax \equiv bx \pmod{m}) \Longrightarrow (a-b)x \equiv 0 \pmod{m}
Or (a-b)x = km for some integer k.
```

$$gcd(x,m)=1$$

 \implies Prime factorization of *m* and *x* do not contain common primes.

 \implies (a-b) factorization contains all primes in m's factorization.

So (a-b) has to be multiple of m.

$$\implies$$
 $(a-b) \ge m$. But $a, b \in \{0, ... m-1\}$. Contradiction.

Proof review. Consequence.

Thm: If gcd(x, m) = 1, then x has a multiplicative inverse modulo m.

Proof Sketch: The set $S = \{0x, 1x, ..., (m-1)x\}$ contains $y \equiv 1 \mod m$ if all distinct modulo m.

. . .

For x = 4 and m = 6. All products of 4...

$$S = \{0(4), 1(4), 2(4), 3(4), 4(4), 5(4)\} = \{0, 4, 8, 12, 16, 20\}$$
 reducing (mod 6)

$$S = \{0, 4, 2, 0, 4, 2\}$$

$$S = \{0, 4, 2, 0, 4, 2\}$$

Not distinct. Common factor 2.

For x = 5 and m = 6.

$$S = \{0(5), 1(5), 2(5), 3(5), 4(5), 5(5)\} = \{0, 5, 4, 3, 2, 1\}$$

All distinct, contains 1! 5 is multiplicative inverse of 5 (mod 6).

 $5x = 3 \pmod{6}$ What is x? Multiply both sides by 5.

$$x = 15 = 3 \pmod{6}$$

 $4x = 3 \pmod{6}$ No solutions. Can't get an odd.

$$4x = 2 \pmod{6}$$
 Two solutions! $x = 2,5 \pmod{6}$

Very different for elements with inverses.

Proof Review 2: Bijections.

If
$$gcd(x,m) = 1$$
.

Then the function $f(a) = xa \mod m$ is a bijection.

One to one: there is a unique inverse.

Onto: the sizes of the domain and co-domain are the same.

$$x = 3, m = 4.$$

 $f(1) = 3(1) = 3 \pmod{4}, f(2) = 6 =$

$$f(1) = 3(1) = 3 \pmod{4}, f(2) = 6 = 2 \pmod{4}, f(3) = 1 \pmod{3}.$$
 Oh yeah. $f(0) = 0$.

Bijection = unique inverse and same size. Proved unique inverse.

$$x = 2, m = 4.$$

 $f(1) = 2, f(2) = 0, f(3) = 2$
Oh yeah. $f(0) = 0$.

Not a bijection.

Finding inverses.

How to find the inverse?

How to find **if** *x* has an inverse modulo *m*?

Find gcd (x, m).

Greater than 1? No multiplicative inverse.

Equal to 1? Mutliplicative inverse.

Algorithm: Try all numbers up to x to see if it divides both x and m.

Very slow.

Inverses

Next up.

Euclid's Algorithm.

Runtime.

Euclid's Extended Algorithm.

Refresh

Does 2 have an inverse mod 8? No. Any multiple of 2 is 2 away from 0+8k for any $k \in \mathbb{N}$.

Does 2 have an inverse mod 9? Yes. 5 $2(5) = 10 = 1 \mod 9$.

Does 6 have an inverse mod 9? No.

Any multiple of 6 is 3 away from 0+9k for any $k \in \mathbb{N}$. 3 = gcd(6,9)!

x has an inverse modulo m if and only if gcd(x,m) > 1? No. gcd(x,m) = 1? Yes.

Now what?:

Compute gcd!

Compute Inverse modulo *m*.

Divisibility...

```
Notation: d|x means "d divides x" or x = kd for some integer k.
```

Fact: If d|x and d|y then d|(x+y) and d|(x-y).

Is it a fact? Yes? No?

Proof:
$$d|x$$
 and $d|y$ or $x = \ell d$ and $y = kd$

$$\implies x - y = kd - \ell d = (k - \ell)d \implies d|(x - y)$$

14/32

More divisibility

```
Notation: d|x means "d divides x" or x = kd for some integer k.
```

Lemma 1: If d|x and d|y then d|y and $d|\mod(x,y)$.

Proof:

mod
$$(x,y) = x - \lfloor x/y \rfloor \cdot y$$

 $= x - \lfloor s \rfloor \cdot y$ for integer s
 $= kd - s\ell d$ for integers k, ℓ where $x = kd$ and $y = \ell d$
 $= (k - s\ell)d$

Therefore $d \mid \mod(x, y)$. And $d \mid y$ since it is in condition.

Lemma 2: If d|y and $d|\mod(x,y)$ then d|y and d|x. **Proof...:** Similar. Try this at home.

GCD Mod Corollary: gcd(x, y) = gcd(y, mod(x, y)).

Proof: x and y have **same** set of common divisors as x and mod (x,y) by Lemma.

Same common divisors \implies largest is the same.

Euclid's algorithm.

```
GCD Mod Corollary: gcd(x, y) = gcd(y, mod(x, y)).
Hey, what's gcd(7,0)? 7 since 7 divides 7 and 7 divides 0
What's gcd(x,0)?
                  Χ
(define (euclid x y)
  (if (= y 0)
     (euclid y (mod x y)))) ***
Theorem: (euclid x y) = gcd(x, y) if x > y.
Proof: Use Strong Induction.
Base Case: y = 0, "x divides y and x"
           \implies "x is common divisor and clearly largest."
Induction Step: mod(x, y) < y \le x when x \ge y
call in line (***) meets conditions plus arguments "smaller"
  and by strong induction hypothesis
  computes gcd(y, mod(x, y))
which is gcd(x, y) by GCD Mod Corollary.
```

Excursion: Value and Size.

Before discussing running time of gcd procedure...

What is the value of 1,000,000?

one million or 1,000,000!

What is the "size" of 1,000,000?

Number of digits: 7.

Number of bits: 21.

For a number *x*, what is its size in bits?

$$n = b(x) \approx \log_2 x$$

Euclid procedure is fast.

```
Theorem: (euclid x y) uses 2n "divisions" where n = b(x) \approx \log_2 x. Is this good? Better than trying all numbers in \{2, \dots, y/2\}? Check 2, check 3, check 4, check 5 \dots, check y/2. If y \approx x roughly y uses n bits ... 2^{n-1} divisions! Exponential dependence on size! 101 bit number. 2^{100} \approx 10^{30} = "million, trillion, trillion" divisions! 2n is much faster! .. roughly 200 divisions.
```

Algorithms at work.

Trying everything Check 2, check 3, check 4, check 5 . . . , check y/2. "(gcd x y)" at work.

```
euclid(700,568)
euclid(568, 132)
euclid(132, 40)
euclid(40, 12)
euclid(12, 4)
euclid(4, 0)
```

Notice: The first argument decreases rapidly. At least a factor of 2 in two recursive calls.

(The second is less than the first.)

Proof.

```
(define (euclid x y)
  (if (= y 0)
         x
         (euclid y (mod x y))))
```

Theorem: (euclid x y) uses O(n) "divisions" where n = b(x).

Proof:

Fact:

First arg decreases by at least factor of two in two recursive calls.

Rreptotofzact: Bead web at sivet exoruptione of the present of the property of

Case 12 IV IPS MENTAL PARTIES IN THE PROPERTY OF SALL P

Where on percentage call call in next recursive call, of divisions and becomes the first argument in the next one.

$$\mod(x,y) = x - y \lfloor \frac{x}{y} \rfloor = x - y \le x - x/2 = x/2$$

Finding an inverse?

We showed how to efficiently tell if there is an inverse.

Extend euclid to find inverse.

Euclid's GCD algorithm.

```
(define (euclid x y)
  (if (= y 0)
         x
         (euclid y (mod x y))))
```

Computes the gcd(x, y) in O(n) divisions.

For x and m, if gcd(x, m) = 1 then x has an inverse modulo m.

Multiplicative Inverse.

GCD algorithm used to tell if there is a multiplicative inverse.

How do we **find** a multiplicative inverse?

Extended GCD

Euclid's Extended GCD Theorem: For any x, y there are integers a, b such that

$$ax + by = d$$
 where $d = gcd(x, y)$.

"Make d out of sum of multiples of x and y."

What is multiplicative inverse of x modulo m?

By extended GCD theorem, when gcd(x, m) = 1.

$$ax + bm = 1$$

 $ax \equiv 1 - bm \equiv 1 \pmod{m}$.

So a multiplicative inverse of $x \pmod{m}$!!

Example: For x = 12 and y = 35, gcd(12,35) = 1.

$$(3)12+(-1)35=1.$$

$$a = 3$$
 and $b = -1$.

The multiplicative inverse of 12 (mod 35) is 3.

Make *d* out of *x* and *y*..?

```
gcd(35,12)
gcd(12, 11) ;; gcd(12, 35%12)
gcd(11, 1) ;; gcd(11, 12%11)
gcd(1,0)
```

How did gcd get 11 from 35 and 12?

$$35 - \lfloor \frac{35}{12} \rfloor 12 = 35 - (2)12 = 11$$

How does gcd get 1 from 12 and 11?

$$12 - \lfloor \frac{12}{11} \rfloor 11 = 12 - (1)11 = 1$$

Algorithm finally returns 1.

But we want 1 from sum of multiples of 35 and 12?

Get 1 from 12 and 11.

$$1 = 12 - (1)11 = 12 - (1)(35 - (2)12) = (3)12 + (-1)35$$

Get 11 from 35 and 12 and plugin.... Simplify. a = 3 and b = -1.

Extended GCD Algorithm.

```
ext-qcd(x,y)
  if y = 0 then return (x, 1, 0)
     else
          (d, a, b) := ext-qcd(y, mod(x, y))
         return (d, b, a - floor(x/y) * b)
Claim: Returns (d, a, b): d = gcd(a, b) and d = ax + by.
Example: a - |x/y| \cdot b = 0135 / 22/11 - 0 = 131
    ext-acd(35,12)
      ext-qcd(12, 11)
        ext-qcd(11, 1)
          ext-qcd(1,0)
          return (1,1,0);; 1 = (1)1 + (0)0
        return (1,0,1) ;; 1 = (0)11 + (1)1
      return (1,1,-1) ;; 1 = (1)12 + (-1)11
   return (1,-1, 3) ;; 1 = (-1)35 + (3)12
```

Extended GCD Algorithm.

```
ext-gcd(x,y)
  if y = 0 then return(x, 1, 0)
    else
        (d, a, b) := ext-gcd(y, mod(x,y))
        return (d, b, a - floor(x/y) * b)
```

Theorem: Returns (d, a, b), where d = gcd(a, b) and d = ax + by.

Correctness.

Proof: Strong Induction.¹

Base: ext-gcd(x,0) returns (d = x,1,0) with x = (1)x + (0)y.

Induction Step: Returns (d, A, B) with d = Ax + By Ind hyp: **ext-gcd** $(y, \mod (x, y))$ returns (d, a, b) with

 $d = ay + b(\mod(x,y))$

ext-gcd(x,y) calls ext-gcd(y, mod(x,y)) so

$$d = ay + b \cdot (\mod(x, y))$$

$$= ay + b \cdot (x - \lfloor \frac{x}{y} \rfloor y)$$

$$= bx + (a - \lfloor \frac{x}{y} \rfloor \cdot b)y$$

And ext-gcd returns $(d, b, (a - \lfloor \frac{x}{v} \rfloor \cdot b))$ so theorem holds!

¹Assume *d* is gcd(x, y) by previous proof.

Review Proof: step.

```
\begin{array}{l} \operatorname{ext-gcd}(\mathbf{x},\mathbf{y}) \\ \text{if } \mathbf{y} = \mathbf{0} \text{ then } \operatorname{return}(\mathbf{x}, \ \mathbf{1}, \ \mathbf{0}) \\ \text{else} \\ & (\mathbf{d}, \ \mathbf{a}, \ \mathbf{b}) := \operatorname{ext-gcd}(\mathbf{y}, \ \operatorname{mod}(\mathbf{x}, \mathbf{y})) \\ \text{return} & (\mathbf{d}, \ \mathbf{b}, \ \mathbf{a} - \operatorname{floor}(\mathbf{x}/\mathbf{y}) \ \star \ \mathbf{b}) \\ \\ \text{Recursively: } d = a\mathbf{y} + b(\mathbf{x} - \lfloor \frac{\mathbf{x}}{\mathbf{y}} \rfloor \cdot \mathbf{y}) \implies d = b\mathbf{x} - (\mathbf{a} - \lfloor \frac{\mathbf{x}}{\mathbf{y}} \rfloor \mathbf{b})\mathbf{y} \\ \\ \text{Returns} & (d, b, (\mathbf{a} - \lfloor \frac{\mathbf{x}}{\mathbf{y}} \rfloor \cdot \mathbf{b})). \end{array}
```

Wrap-up

```
Conclusion: Can find multiplicative inverses in O(n) time!
Very different from elementary school: try 1, try 2, try 3...
 2n/2
